

REDWOOD ROBOTICS™ SOFTWARE

REDWOOD

SCALABLE ROBOTICS AND UNLIMITED VALUE

Moving essential back-office activities from a manual or task-based approach to fully automated processes can be a daunting proposition. The solution you use must deliver results across your organization quickly and continue to provide value over time.

Redwood's differentiated approach gives you rapid, measurable benefits that continue to grow with your organization. Our enterprise-ready automation solution provides clear and direct functionality to develop, orchestrate, execute, manage and report on an unlimited number of automated processes and system tasks, with full program oversight and audit compliance. Our technology

is a multi-tier, server-based solution built to support the needs of global organizations planning to reap the benefits of process automation immediately and as they scale across the organization.

Redwood Robotics software includes ready-to-use automated process activities for common back-office tasks used throughout finance, procurement, supply chain management and human resources processes. This accelerates your Time-to-Value (TtV) by using far fewer development, maintenance and infrastructure resources than other technologies. It's how we maintain the lowest total cost of ownership in the industry.

Redwood's differentiated approach gives you rapid, measurable benefits that continue to grow with your organization.

CATALOG OF READY-TO-USE ROBOTIC ACTIVITIES

Redwood's catalog of automated process activities arrive ready to use. These building blocks of robotized processes employ standard connectors that work directly with enterprise applications including SAP®, Oracle® and PeopleSoft, along with business applications, including Microsoft Office and a wide range of other systems and web services. We connect to email, PDFs and other information sources right out of the box. Our robotic process activities are created according to best practices and are built, maintained and supported by Redwood experts.

Our catalog is a valuable resource for our customers who use it to quickly automate a wide range of common processes. We're constantly adding new elements to our ever-growing library, which are available for our customers to use wherever they like. Of course, if you need to make your own process activities, our built-in wizards simplify their creation, allowing you to add new robotic activities to your organization's own catalog for easy redeployment.

MATURE PROCESS DESIGN AND ORCHESTRATION

Automating complex end-to-end processes requires coordinated orchestration of many different activities. Redwood Robotics technology simplifies the coordination of human and automated tasks (including hand-offs between the two) through our mature process design and orchestration functionality, as well as built-in Business Process Management (BPM) capabilities.

With our process studio, users can quickly build their own processes with pre-made automated process activities. They can include interactions with standard

systems, data extraction from documents, data analysis and enrichment, user interactions and approvals, logic and complex process mapping, as well as additional functionality, as required.

Processes can then be coordinated and managed through our process orchestrator functionality. This enables complete control of multiple end-to-end processes from a single point of management. Control complex processes, such as month-end close and employee on-boarding, all from one screen.

INSTANTLY SCALABLE ARCHITECTURE

Redwood's integration-based API architecture means our solution is faster, simpler and instantly scalable to meet the fluctuating automation needs of the organization. By connecting directly to systems, our technology eliminates the limitations found in automation tools that

require a user interface for execution. Our technology instantly scales to meet automation demand. Redwood Robotics quickly and efficiently executes processes in multiple systems (both in sequence and in parallel), significantly improving execution, speed and accuracy.

COMPREHENSIVE PROGRAM MANAGEMENT TOOLS

Redwood makes managing your process automation program easier through our comprehensive management tools, which include real-time process monitoring, SLA alerting and management and customizable process dashboards.

Our central process monitoring functionality provides a real-time view into currently scheduled processes, along with those that are in-process, waiting for review or recently completed. This gives you vital and timely information about processes as they happen. Additionally, organizations can monitor and enforce established SLAs through automated escalations, ensuring processes are completed in the expected timeframe.

With our customizable process management dashboards, users can understand valuable process execution data, including established KPIs, customized for each business unit.

AUDIT AND CONTROL

Redwood Robotics delivers comprehensive control and compliance capabilities that support Sarbanes-Oxley requirements and meet the needs of the IT organization. Redwood automatically publishes process audit information to a centralized, secure archive that

both internal and external auditors can easily access. Additionally, it can be configured to comply with any organizational data requirements, reducing or eliminating the need for additional audit monitoring.

RETHINK ROBOTICS

Redwood is a global leader in our domain, focused only on automation for more than 25 years. We deliver flexible and managed solutions that free your best people from repetitive manual tasks. We would welcome a conversation about how we can help you reach your goals.
